

- **Stationary:** This type of Point Light actors will have its shadowing and bounced lighting from static geometry that is baked by Lightmass, while all other lighting can and will be dynamic. In other words, this actor allows for the change of colour and intensity while it remains stationary and allows for partially baked lighting.
- **Movable:** The term simply means that this type of Point Light actor is purely dynamic in nature, which means it allows for dynamic shadowing as well. Hence, it is slow in terms of rendering, but it is the most flexible of the three mentioned Point Light Actors.

Spot Light

The Spotlight actor like the real-life spotlight, emits the light from a single point source in the form of a cone, but with this one, the users are given two types of cones to choose. These are Inner Cone Angle and the Outer Cone Angle. Within the inner cone, the light reaches its maximum brightness and as you move from inner cone to the outer cone, some kind of fall-off takes place and it creates a penumbra or softening around the illumination point of the spotlight. Here, the radius defines the size of the cone of the spotlight, just like a flashlight or a stagelight. Like the Point Light, Spot Light can also be set in three settings of mobility which include Static, Stationary and Movable.

Directional Light

Directional Light stimulates the light source that is at an infinite distance from the place it where the light falls on. Perfect for emulating sunlight, this Directional Light Actor can also be set in three types of mobility settings - Static, Stationary and Movable.

Rect Light

The Rect Light is a kind of light that emits the light into a particular scene from a rectangular plane which has a fixed height and width. You can use the Rect light to depict any light source that has a rectangular surface area like TV Screen, Monitors, Overhead Light fixtures, etc.

The Rect Light has a spherical attenuation Radius just like the Point or the Spotlight and it will always emit the light within the positive side of the attenuation Radius. Just like Other Light Actors, Rect Light also has three mobility settings, once again, Static, Stationary and Movable.
