

all classes of the network without using the desk property to describe individual nodes.

Comments are displayed as text banners at the top of the text. This text does not scale with the zoom level of the graph, so when zoomed in remotely, you can still read the comment details.

To create a comment box, you can do the following:

- When the Material Graph is over, press the C keyboard shortcut. If any nodes are selected in your graph, the option to add a comment box option is scaled.
- You can use the content graph context menu by right-clicking to select a new comment and add a comment box.
- Any nodes bound in the comment box can be moved by dragging them to the group comment text so that any node with it can be moved. The framework can be formatted by dragging it to the edges of the comment box to add additional nodes.
- The colours in the comment box can be adjusted for those with greater visual impairment. You can use the Detail panel to set the comment colour attribute to select the colour or use the colour wheel to enter a specific RGB value.
- You can rename your comments by double-clicking the comment text banner or selecting the comment box and then editing the text property from the details panel.

Geometry Brush Actors

Geometry Brush Actors may well be defined as the most basic tool for level building in Unreal Programming Applications. Conceptually speaking, one can also think of Geometry Brush Actors as filling in and carving out space within your level where they are applied.

Although previously Geometry Brush Actors
