

Level Designers can simply use the tools which are in-built into the Unreal Editor in order to create and modify Geometry Brushes till the time they are happy with the layout and the flow of the level. So, while you are testing and prototyping your next level, you can just tell your art team to build Static Mesh for the upcoming level that is being tested.

Once the testing is finalised, Meshing begins and Geometric Brushes are gradually replaced by Static Meshes. In this way, Geometric Brushes allow for the faster iteration plus they work as perfect examples for your art team to build upon.

Simple Filler Geometry

Sometimes, when a level designer is creating a level, they will come to a situation where they'll be needing fairly simple Geometry to fill up the gaps and spaces within the level. While they would prefer a Static Mesh in the situation but if no such mesh is already built and all they require is a simple Geometry, instead of ordering the art team for a Custom Mesh they'll use Geometry Brushes to fill in space. You might think that Static Mesh is better performance-wise. It is true, but Geometric Brushes can be used in place of Static Mesh from time to time for providing the Geometrical Structure that is required to be really simple.

Brush Order

The order in which the brushes are placed is important since addition or subtraction operations are carried out in this order. Placing a subtractive brush and then placing an additive brush on an additive brush and then a subtraction brush does not have the same effect, even if it is in one place.

If you remove it from the free space and add on top of it, the subtraction brush is essentially ignored because you cannot remove anything. However, if you put the same brushes in the opposite order, you are adding more space and removing extra sculpted space from it.

Atmospheric Fog

Atmospheric fog gives an estimate of the dispersion of light by a planetary atmosphere. It also gives your outer levels a more realistic look. This total effect has the following:

- The dominant directional light in your level gets the Sun Disc effect in the sky. It is placed too far opposite the direction of light.
