

If your game requires something else, you can replace this behaviour with any of your actor types. For example, if the player needs a key or other object to collect in order to get into the game lava pit, your game may want to send it back to the area where the player can reach it without destroying it. Or, at least tell the player that the item is gone and reload the last checkpoint, instead of leaving the game unexpectedly.

4. Volume due to pain

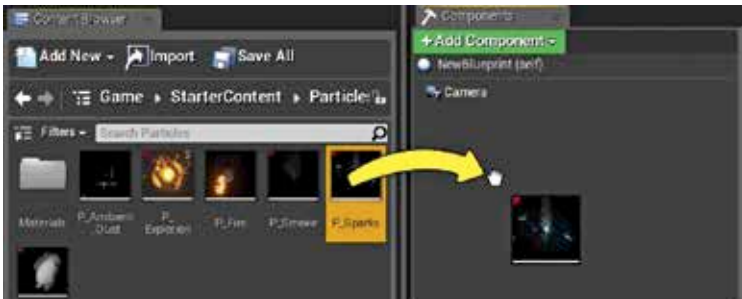

The causes of pain are volume physics volumes that have the potential to harm players. For example, these are useful when you have a level field where a player should not go, such as a lava pit or a cloud of toxic gas.

Physics Volumes

Physics Volumes can change physical setups that affect characters and other physical objects. One common use for them is to create a water environment in which the player needs to swim. The effects of physical volume can be seen and understood as desired. The Character Move component adjusts how the class moves through its own character environments using the current field.

Components

Components are a special type of object that actors can attach themselves to. Components are used to share common behaviours, such as the ability to display visual representations and play sounds. They may also refer to project-specific concepts such as how the vehicle understands input and changes its own speed and orientation. For example, a project vehicle consisting of consumer-controlled cars, planes, and boats can implement differences in the control and movement of the vehicle used.

Add pitch-perfect components to give more details to actors
