Creating a Blueprint

Here are some of the most common Parent Classes

- **Actor:** It is the main object or an object that you can place or originate in the world
- **Pawn:** It is an actor that can be possessed and that receives direct input from the controller for changes.
- **Character:** It is a pawn in the game that can do several things such as walk in any direction, jump, and do more.
- **PlayerController:** It is the Actor responsible for controlling a Pawn that is being used by a player only.
- **Game Mode:** It is the main Game Mode that defines the various aspects of the rules, scoring, and parts of the game types in general.

You can also use any existing classes to act as Parent Class for creating a new Blueprints. Level Blueprints and Blueprints Classes are both the common Blueprint types used in Game scripting. For beginners, it can be difficult to choose the right type of blueprint. On a general note for limited scope or instance you must use Level Blueprint and for multiple instance use Blueprint Classes.

Data-Only Blueprint

These are a special type of Blueprint Class that consists of code (node graphs), components, and variables inherited from the parent class only. Though you can modify and tweak these inherited properties, you still
