

can't add any new elements to this. These act as a better replacement for archetypes only and thus helping designers make changes in properties seamlessly or give different variations in a given item.

Blueprint Interface

These are the collection or result of using one or more functions together designed in a way to be used in combination with other blueprints. So, basically when this interface is added to any blueprints it guarantees to run specific functions of that interface. This workflow assumes the common concept of the general programming that allows similar objects to be used through a common interface.

Blueprints Interfaces are created similarly like a blueprint in the editor though they have some restrictions associated with them such as not able to edit graphs, add any components or any new variables through them.

In a more general sense, Blueprints Interfaces gives the whole system platform to share and send data to each other harmoniously.

Blueprints Interfaces can be created visually from the editor using the context menu only. You can name them as per your preference, edit interfaces, and add more functions depending on the game requirements.

Blueprint Macro Library

These are the container that has collections of Macros or specific self-contained graphs to be used as anodes in any of the blueprints. These libraries are highly time-saving to store commonly-used sequences of nodes for data transfer and executions respectively. Macros are often auto-expanded into graphs and shared among them all as they are stored in the packages itself. You can easily create and access them through the editor.

Blueprint Utilities

Also known as Blutility, Blueprint Utilities are editor-only Blueprints that are used to perform any specific actions or thereafter extend any other editor functionality. They can expose Events using no parameters as a button and then subsequently execute any function to Blueprints on any selected Actors in the viewport of the development.

Anatomy of Blueprints

Along with Blueprint classes, there are several important features inside Blueprint that one should know about. Understanding Components,
