

the Components Window, Graphs, Event Graphs, Functions, Variables, Macros, and Blueprint Modes will help you combine concepts better in this Blueprint system. Now, we are going to study each of these elements with a short explanation.

Components

Components are specially designed additional functionality for an actor. These can't exist on their own, though when added to an Actor, Components gives them added functionality such as spot-light, audio, rotating movement, etc. Several types of components are present such as AI components, Audio, Camera, Light, Movement, Navigation, Paper 2D, Physics, rendering, Shape, Skeletal Mesh, Static Mesh, Widget,

Components Window is available inside the Blueprint editor to use additional functionality for your actor. These can be assigned to any variable in the graph or through blueprints. You can easily add components using the component window. Select the precise type of component and name it thereafter.

You can use drag and drop from content browser to add components to your actor. Similarly, to remove any component, first select the respective component name and then select Delete.

Adding Components

Graphs

In simple words, a graph is a collection or network of nodes that are connected for defining the flow of execution for any network. Graphs are the fundamentals for implementing functionality within blueprints as they provide the communication from one node to another.

Depending on the type of Blueprint, each one of these blueprints may contain one or many graphs inside them as per the implementation of the whole flow of the blueprint for any project. A graph inside a blueprint may contain various sub-graphs that are collections of nodes built mainly for organisational purposes. Various types of graphs are used for their unique
