

the same Blueprint while Global variables are accessible to multiple levels within Blueprints. In the next section, we have given a detailed explanation for working with Variables.

Blueprint Modes

These Blueprint Modes define the visible options inside a window. Level Blueprints will contain one mode with Graph Mode where graphs are displayed, and Blueprint Classes have two additional modes.

- **Default Mode:** To set the various defaults for Blueprints
- **Components Mode:** To add, remove and change or modify the components that built the blueprint.

Blueprint Macros

Blueprint Macros are similar to a graph of nodes with one entry and exit point specified by tunnel nodes. Each of these tunnels may have multiple numbers of data pins or executions that are visible in other graphs and Blueprints too.

How do you create a Blueprint Macros?

Just like a function, you can create Blueprints Macros in a Level Blueprint or Blueprint Class and collected inside Blueprint Macro Libraries.

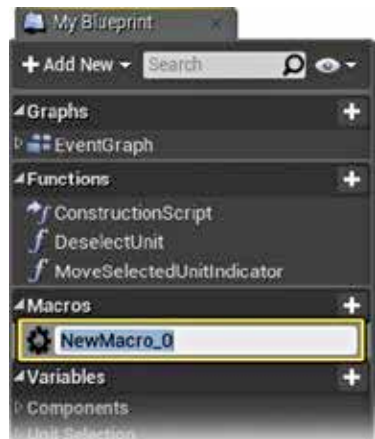

Start from the My Blueprint tab, go the new Macro option and add + with a relative name.

Thereafter a Blueprint Macro opens up in the Graph tab of the Blueprint Editor.

Similarly, you can also create a Macro by right-clicking the My Blueprint tab and then choosing the Macro from the context menu.

Building Blueprint Macros: As defined Macros have one input and output tunnel nodes.

From the detail panel for your Blueprint Marco, you can fill out the description, category, and instance colour respectively. Here, you can also add input and output parameters with specific values and data types.

Creating a Blueprint macro
