You can set score parameters

You can add a Macro node to any Blueprint graph by either right-clicking and adding the Macro from the context menu or just using drag and drop into the graph itself. Once added to the graph it assumes all the properties of graph node. You can know all the information for the Macro graph just by double-clicking on any given Macro node.

You can also add multiple nodes of the Macro inside the graph throughout your blueprint in the project.

Blueprint Variables

Variables are the special assets that can hold any value or reference in a gameplay environment. You can make significant changes to them internally or externally. Variables are represented as coloured, rounded boxes with their name on it.

Blueprint Variables

Types of Variables

Several types of Variables are there in Blueprints such as Integer, Boolean, Float, and they also include objects, actors, and classes. These variables are coded in separate colours to identify them easily anywhere in the environ-
