

ment and subsequently, arrays of each variable type can also be created. Here is a list that signifies the types of Variable used in Blueprints generally.

| Variable Type | Color           | Representation                                                                                |
|---------------|-----------------|-----------------------------------------------------------------------------------------------|
| Boolean       | Maroon          | Either True or False Value                                                                    |
| Byte          | Sherpa Blue     | Number value between 0 and 255                                                                |
| Integer       | Sea Green       | Whole Number value anything between -2,147,483,648 and 2,147,483,648 respectively.            |
| Integer 64    | Mos Green       | Whole Number Value between -9,223,372,036,854,775,808 to 9,223,372,036,854,775,808.           |
| Float         | Yellow Green    | Any Number value with decimals such as 0.3345.                                                |
| Name          | Mauve           | Any text that identifies some aspect of the game.                                             |
| Text          | Pink            | Text to display for the users.                                                                |
| Vector        | Gold            | A set of three coordinates for 3D and RGB (x,y,z).                                            |
| Rotator       | Cornflower Blue | Group of number that defines rotation inside the 3D space.                                    |
| Transform     | Orange          | Combined set of data that shows translation (3D position), scale and rotation.                |
| Object        | Blue            | Main blueprints objects such as Actors, Lights, Cameras, StaticMeshes, SoundClues and Others. |

You can use My Blueprint Tab to add any more custom variables in the environment or use any pre-existing variable from there.

## How to Create a Variable in the Blueprints Editor?

From the MyBlueprint Window, You can create a new variable by clicking on the Add Button just as shown in the window here.

Thereafter a new variable will be created as you enter the name for it.

In the Detail panel there are several options that you can assign to Variable namely:
