

Options	Desc
Variable Name	A Specific name for the Variable.
Variable Type	Setting the type and determining it as an Array or not.
Instance Editable	Options to check whether the variable is allowed to be edited publicly from Blueprints.
Blueprint Read Only	Option to check whether the Variable can be modified by Blueprint nodes or read-only.
Tooltip	Any special or extra information about the variable when someone moves their cursor on the Variable.
Show 3D Widget	When selected, this option allows the user to tweak the vector variable by using a 3D transform widget in the viewport section.
Expose on Spawn	This option makes the variable be exposed as a pin when spawning the Blueprint.
Private	This option makes the Variable Private (derived Blueprints cannot modify it).
Expose to Cinematics	This option allows the variable to be exposed to Sequencer or Matinee in modifying it.
Config Variable	Allows the variable to be set from a config file.
Category	This option allows you to categorise the variable by any specific label.
Replication	Is this variable allowed to replicate over the network or not.

Promoting to Variable

From any input or data point in the Blueprints Nodes, you can select them and right-click for using the Promote to Variable options and assign options to it. In a similar way you can change the colour to match your requirements.

Blueprint Arrays

Arrays may be defined as a collection of variables that must be created within a single unit. You can store different data points within any Array. Though an Array once defined will only hold values of a specific single type i.e, a Boolean Array will have Boolean Values, an Integer Array will have integer values.
