

Blueprints Workflow Tool

Understanding the workflow inside a Blueprint is important. Tools like Commenting and Breakpoints allow one to keep up with the systematic flow of the code and then notify you as well as other teammates that are working on the same system.

Commenting

Comments play a significant role in making the whole graph readable and also serves the informational purpose with textual descriptions of the whole code. There are two ways to add comments either to the Single Blueprint nodes directly or use the comment boxes for group related nodes. Comments primarily are used for organisational purposes only, and help programmers and designers both to understand the flow of the graph easily.

Adding Node Comments

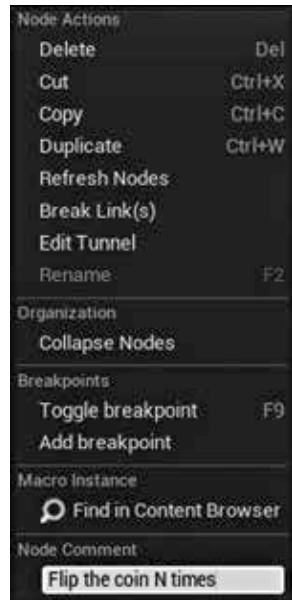

- Just make a right-click on any node.
- Then add the comment in the Node Comment box.

Thereafter, your comment will appear on the small comment tip above the node.

You can make edits to this comment by again right-clicking and making changes as needed. Similarly, delete the comment when it is no longer needed.

Comment Boxes

- Start by selecting the group of nodes for which the comment box is made. You can also first create an empty comment box and then rearrange nodes around it.
- Then right-click and select the Create Comment from selection of the contextual menu. Or you can also press C directly to create a comment too.
- Thereafter, a comment box will appear
