

this list, you can check and inspect each variable, functions, and outputs along with movement between the blueprints to know the whole flow. Here you can make a thorough drill down examinations of the Sets, Arrays, Maps or any other data structures as per convenient.

Call Stack

This Call stack uses the same concept found in C++ programming environments as it gives information about the flow of execution between the Blueprint and native (C++) code with the latest Blueprint Function executed on the top of the stack.

As soon as a Breakpoint is hit in the environment, the Call stack thereafter lists all the functions currently operating with current function at the topmost position.

Each line has a name of a function and thereafter each entry has a function that was called before this function. When there are recursive or self-calling functions the entry for the same function may appear several times in a row.

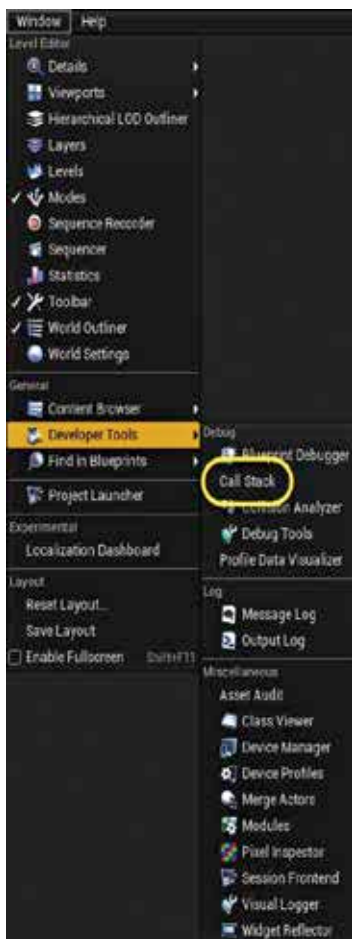

You can view Call Stack screen from the Window dropdown and under the Developers Tools Menu thereafter.

Execution Trace

This shows all the list of nodes that are executed with the latest nodes at the top thus helping designers and programmers to understand the whole flow of the project.

Timelines

Timelines nodes are specially designed nodes for simple time-based

Call Stack
