

Input	Description
Play	When used this will cause the timeline to play forward from its present time.
Play From Start	When used this will restart the timeline from the start again.
Stop	When used this will pause the playback at its current state.
Reverse	When used this reverses the timeline from its current time.
Reverse from End	This plays the timeline backwards, starting from the end.
Set New Time	This will set the current time to the value provided in the New Time input.
New Time	This input pin uses a float value time in seconds that Timeline will jump in case the Set New time input is called.
Output Pins	
Update	This outputs an execution signal as quickly as possible when the Timeline is called.
Finished	This gives the output a specific execution signal when the playback even ends. It is not triggered using the stop function.
Direction	Output data that indicates the timeline direction of playing.

Events such as opening doors, flickering lights in Games are precisely used Timeline events to accomplish.

Blueprint Best Practices

Blueprints Visual Scripting system is highly useful for building a small game, prototyping for new functionality, content tools, polishing, tweaking and enhancing the existing features of the game environment.

Blueprints are ideal for event-driven functionality such as handling controls, small animations, damage taking, and other elements that are not required for every frame. For complex operations and math tricks, native C++ code is still your preferable choice.

Blueprint can help you develop various aspects of the Game environment and many such best practices are followed in general. Below we have mentioned some of the top practices along with tips and tricks that will help you to make the correct decision when working with Blueprints.

- When choosing between the Level Blueprints and Blueprint Classes, you must consider selecting the Blueprint Classes for reusable purposes in the project. As Blueprint Classes once created you can use them multiple locations rather than copying the script at every location. Though Level Blueprints are better for one-off prototypes, still they
