

The `SpectatorPawn` class is derived from the `DefaultPawn` class. Similar to the `DefaultPawnMovementComponent` it also has a no gravity style. The movement of this pawn is handled in the `SpectatorPawnMovementComponent`.

Coding a new pawn in C++

1. Create a new C++ actor class, the header files should have the axis movements and bool functions.

```
• #pragma once
• #include "CoreMinimal.h"
• #include "GameFramework/Pawn.h"
• #include "MyPawn.generated.h"
•
• UCLASS()
• class UNREALCPP_API AMyPawn : public APawn
• {
•     GENERATED_BODY()
•
• public:
•     // Sets default values for this pawn's properties
•     AMyPawn();
•
• protected:
•     // Called when the game starts or when spawned
•     virtual void BeginPlay() override;
•
• public:
•     // Called every frame
•     virtual void Tick(float DeltaSeconds) override;
•
•     // Called to bind functionality to input
•     virtual void SetupPlayerInputComponent(class UInput-
Component* InputComponent) override;
•
•     UPROPERTY(EditAnywhere)
•     USceneComponent* OurVisibleComponent;
•
•     // Input functions
•     void Move_XAxis(float AxisValue);
•     void Move_YAxis(float AxisValue);
```
