

2. Make it a blueprint and save it in a folder, when asked to save.
3. This is the screen after the event graph
4. The viewpoint tab is the place to edit the pawn

With Unreal Engine, you can easily create Pawns with few easy steps

5. Rename the default scene root and add camera views to it. You can save the view like ex. Head.
6. Now, it's our turn to control the pawn. In the right sidebar under the VR_Pawn component, change the Auto possess player to Player O.
7. Now, you are good to add some motion controls to it.
8. Click on the asset browser to add motion controls
9. Add component and select motion control. Make the motion source to the right
10. Add a component and duplicate it to make it the left source
11. You can add inputs to your project at edit>project Settings then find the input section.
12. Right-click to create new nodes and movements

Characters

Character is a humanoid pawn with basic bipedal movement functionality by default. A pawn class is made as a character class with the addition of CharacterMovementComponent, a CapsuleComponent, and a SkeletalMeshComponent. It has all vertical player orientation such as walk, run, jump, fly, and swim that are implemented with basic networking and input models.
