

A flow chart showing how PlayerController works

- `InputComponent->BindAxis("MoveForward", this, &ASampleCharacter::MoveForward);`
- `InputComponent->BindAction("Fire", IE_Pressed, this, &ASampleCharacter::OnBeginFire);`
- `InputComponent->BindAction("Fire", IE_Released, this, &ASampleCharacter::OnEndFire);`

In blueprint you can place the Axis or Action Event node from the Input section present in any Actor Blueprint.

The following is the C++ code to add Bind button to the character.

- `protected:`
- `/** Fires a projectile. */`
- `void OnFire();`
- `// on action`
- `void OnAction();`
- `PlayerInputComponent->BindAction("Action", IE_Pressed, this, &AUnrealCPPCharacter::OnAction);`
- `void AUnrealCPPCharacter::OnAction()`
- `{`
- `if (GEngine)`
- `{`
