Conclusion

Unreal is an excellent choice if you are building action-based games with narratives that are AI-controlled. Although the C++ programming of the players and the controls are possible, modeling the players through nodes is the widely preferred method. Besides the fact that there are default player states available, there are ample ways to custom create a player and help is widely available. So, the next time you choose to design a game using Unreal, custom develop the players as you wish.
