

- Once you have clicked on 'save selected' Unreal removes asterisk and this will indicate that all of the audio files are saved.

Importing multi-channel audio-

Exporting the multi-channel sound files will essentially create a mono .WAV file for every channel and it will follow the multi-channel audio extension naming conventions. Follow these instructions-

- Click the import button in Content Browser
- Now you have to locate and select your .WAV files
- In order to import the audio files, you have to click 'open'
- Once the import progress bar fills up, inside the content Browser a four-channel sound will appear which will indicate the import of the files.

For the unsaved sound asset, an asterisk sign will appear to get well prompt you to click on the 'save all' option. You have to save the content from the 'save content' dialog box. Later, hover over the assets in the content Browser for a preview of the sound assets summary.

Properties of audio-

- **Spatialisation and head tracking** - it involves transforming monophonic sound sources to make them more accurate and sound as they originate from a definitely desired spot.
- **Audio propagation** - it provides real-time occlusion, simulation or reverbs based upon the geometry of the game. This can be done by tagging the scene mesh which you want to include in the simulation and then selecting the most acoustic material from individual meshes.
- **Volumetric sources** - the sound sources can provide for any given radius to make more sound volumetric. It is also capable of spreading sound outdoors.
- **Near field rendering** - the sound sources which are located in the closest proximity to the listener have some properties to make aspects of the spatial independence of the distance. It automatically approximates the overall effect of sound reflection in order to create a better and more realistic representation of the audio source.
- **Synchronisation** - it includes the speech and laughter sounds.

Learning sound cues and applying different filters

In the Unreal engine behaviour of any audio play back file is defined with the assistance of sound cues. Also, the sound cue editor is a node-based editor that is utilised to work with audio files.
