

Sound cue

A sound cue refers to an asset that lets users manipulate the whole sequence of sounds and combine them easily. Unreal also gives freedom to treat sound cue as to its own sound as in regular sound use you can also consider using a sound cue. The combination of nodes created within the editor is represented by the audio output in the sound cue editor and save as sound cue. By default the node of every audio graph of the sound cue contents an output node having the speaker icon. The value for the output for the volume multiplier is around 0.75 and for pitch multiplier, it is 1.00. These values can easily be modified.

To manage the relative sound cue volume and pitch settings are used and it affects the overall output for the audio containing sound cues. If the developer is using multiple sound waves along with the mixer or any other random notes then the volume and pitch settings can be independently controlled adding some modulator nodes to it.

The representation of an imported audio file is known as Sound wave

Sound waves-

The representation of an imported file in the sound cue editor is known as a sound wave and you can select any sound wave asset from the content Browser. Later you can edit it by right-clicking at any spot in the sound cue editor.

How to create sound cues-

In order to create the cue, follow these steps-

- Click 'Add new' in the Content Browser or right-click anywhere in the content browser to bring asset menu
