

- Under 'Other assets,' you have to click 'sound' and then 'Sound cue'
- Now you can type the name of the new sound cue

You can also open the sound cue editor by simply clicking on the sound cue asset in content Browser and then click on 'Edit' in the context menu.

Sound cues are more or less like a blueprint for the audio where you can combine multiple effects and local modifiers to get the desired output. You can also consider it as an actual sound input and then specify them in detail considering the combinations to get the output.

- **Mature filter** - In the dialogue context you can easily apply to match your filter to flag the dialogue containing adult content.
- **Script** - Under this, you can enter the text which is mostly spoken in the attached audio file inside the section of 'spoken text'.
- **Voice actor direction** - In order to add any contextual information in the audio files for translation purposes or to know them for voice actor you can do the needful in voice actor direction section.
- **Add dialogue context** - If you have to apply multiple actors saying the same line of dialogue then you can apply the 'add dialogue context' filter which will allow you to create a new entry page for the dialogues where you can set the audio system to a new speaker and then direct its individual sections.

Sound attenuation

It refers to the assets which allow the defining of attenuation properties in a reusable form. At any segment where are you specify the one-time use attenuation properties you can preferably specify the asset of sound attenuation. This also enables the adjustment towards attenuation properties without having the need to revisit sound segments individually.

Reverb effects

In Unreal, reverb effects means the definable asset having multiple properties that can be easily modified or adjusted to the 'audio volume' placed in the game levels. With this effect, you can easily adjust to the settings allowing the user to control multiple elements like overall reverb gain, air absorption, echo density and so on.

Sound classes

Sound classes are the actual collection of properties that can be applied to the sound assets in a large number. The properties of sound classes also act as a multiplier for the existing values and they can be carried out by the sound
