

other hand, `Col_index_num` is a column number available in `table_array` from which the value in a comparable row is returned.

The following example considers the marks and student names in various subjects in column E to B.

Here, you can find the score of Ricky in Math. The VLOOKUP formula for calculating the Math score is `=VLOOKUP("Ricky", $A$3:$E$10, 2, 0)`

It can look at Ricky's value in the Name column. After that, it moves from top to bottom for finding the score in a cell A9.

	A	B	C	D	E	F	G	H	I	J	K	L
1												
2	Name	Math	Physics	Chemistry	Biology							
3	Tom	85	59	84	80							
4	Jeff	56	74	76	64							
5	Shane	66	84	77	57							
6	Maria	49	35	91	63							
7	Donald	52	56	89	70							
8	Rob	78	86	59	71							
9	Ricky	81	69	42	79							
10	Chris	88	69	52	88							
11												
12			81									

2. XLOOKUP

A newer Microsoft Excel function, the unique thing about this is that it is pretty much MATCH/INDEX, IFERROR, HLOOKUP, and VLOOKUP all rolled into one.

See the data shown in the image below? You can use XLOOKUP instead of. All you need to do is specify the ID column and return the value column. Here are the inputs you need to know:

- **Lookup_Value** – A single cell input or value
- **Lookup_Array** – A range input to find Lookup_Value within

	A	B	C	D	E	F	G	H	I	J	K	L
1												
2	Employee ID	Name	Salary	Commission	Commission							
3	0000123	James Fitz	\$200	10%	\$20							
4	0000124	James Fitz	\$200	20%	\$40							
5	0000125	Jeffrey Williams	\$250	20%	\$50							
6	0000126	Tim Brown	\$225	20%	\$45							
7	0000127	Emily Smith	\$210	20%	\$42							
8	0000128	Emily Smith	\$210	10%	\$21							
9	0000129	John Smith	\$250	10%	\$25							
10	0000130	Chuck Fawcett	\$270	10%	\$27
