

- **Return_Array** – return the value linked to Lookup_Value
- **If_Not_Found** – What should the formula do when it fails to find anything? Can also be used to output a specific phrase by putting “” around the phrase.
- **Match_Mode** – Optional. Choose how XLOOKUP searches the lookup array range that you provided.
- **Search_Mode** – Optional. Choose what order to search in.

3. INDEX & MATCH

INDEX returns a value of the element in an array of the table chosen by the provided index. MATCH searches for the mentioned item in the cells and returns the relative area of that particular item in a range. When you use these two functions jointly, you will achieve a similar result offered by the LOOKUP function.

IFERROR Function

This advanced Excel formula returns a result quickly if you have an error in your formula. This lets you manage errors better without resorting to complex IF statements. The syntax is as follows:

IFERROR (value, value_if_error)

The screenshot shows an Excel spreadsheet with the following data in columns A, B, and C:

	A	B	C
1			
2	789	2	384.5
3	679	6	#DIV/0!
4	554	4	138.5
5	900	6	120
6	453	8	56.625
7	90	11	8.131818
8	234	6	39
9	456	7	65.14286
10	678	3	126
11	135	9	15.11111
