

If the error is trying to divide by 0, it will show #DIV/0! Error, and if you use there is some other error, you see an empty string (“) displayed.

Dynamic Array Excel Functions

Have you ever found yourself online looking for a complex formula, and then you find a solution, paste it into your cell, use [Ctrl] + [Shift] + [Enter] to modify it, and voila, problem solved? Why does this happen? Because the formula is an array formula. Array formulas are complex, and hard to write up, but Microsoft introduced a new range of Excel functions in 2019 to try and solve for this. Now, there is a new option called Dynamic Array functions, and these can do away with the need for lengthy/complex formulae, introduces formulae that are easy for even beginners to use.

The Office suite comes with certain functions called UNIQUE. It can feed unique an array of cells and also return every single exceptional value
