

that it finds into the individual cells. In simple words, if the list of given values shrinks or grows over time, then the list returned by the UNIQUE formula is automatically adjusted.

## ROUND Function

A simple yet cool feature of Excel is the round formula, which helps get rid of too many decimal places.

If you want to simplify this process, you can make use of this formula, which is `ROUND(B2/C2,2)`. It will format the Excel cell to two decimals. Also, it will show it accurately.

## Named Ranges

Another good formula is the named range feature. As the name suggests, it helps name the ranges, which make it easier to use these names in other formulae. Here's how it works:

- Click the **Formulas** button on top of the ribbon
- Click on **Create** from the Selection button
- Then you just select the suitable ranges and provide names. for giving names

An example of this in action is on the previous page.
