

Input Restriction

Do you want to preserve the data validity of your sheet, and prevent someone from adding in data they shouldn't? That's where Input Restriction comes in. All you need to do is examine the input range, and then set your restriction. For example, if you are capturing dates of birth in the DD/MM/YYYY format, and you assume that everyone inputting data into this field is between 18 and 60-years old, then Input Restriction will stop people from entering data that is not within this ranger. If a 27 year old accidentally types 72 instead of 27, or changes a digit in a year format, to make their date of birth 1939 instead of 1993, then your sheet will throw up an error and force them to recheck their input.

To do this, just go to **Data > Data Validation > Settings**. After that, you can input the possible terms as well as a shift to the Input Message. It helps to give suggestions such as, "Please enter your birth date in the format of DD/MM/YYYY. And the year should be between 1960 and 2002."

Hide Data

Most Excel users just right-click and select 'Hide' when they want to hide some data. The problem is, you might forget that you have hidden it, or end up having to hide and un-hide constantly. Instead, you can just format cells to hide data. One of the smoothest and safest ways of hiding the data is to use the function of Format Cells. To achieve the best results, you can follow the given steps.
