

Pick the area and go to Home > Font > Format Cells, click on the Number tab, go to Custom > type “;;;” (without the quotes) and click OK. You can do this for a single cell, a column, a row, or any selection that you can make. In order to show the text again, just select the hidden cells, go back to the same Number tab and change it from Custom to General, and everything goes back to normal.

Remember: The formulae or values of the cells that are hidden will still show up on top in the function bar on the ribbon.

ACCRINT

This function is used to determine an accrued profit for a bond, which brings in interest periodically.

It also helps you to determine an accrued benefit on a security (like a bond), when that protection is transported or traded to a new buyer. This function is available in

Microsoft Excel 2007 and later only.

Here is the formula of ACCRINT:

```
=ACCRINT(issue, first_interest, settlement, rate, par, frequency, [basis], [calc_method])
```

These are only but a few Excel tips, and honestly, you could fill this entire book with just amazing Excel formulae. It's a really powerful software, and that's why it is first on our Essential Software list! **d**

	A	B
1	Issue Date	1/01/2013
2	First Interest	1/04/2013
3	Settlement Date	1/02/2013
4	Rate	7.50%
5	Par Value	1,000
6	Frequency	4
7	Basis	2
8	Calc Method	1
9		
10	Formula	Result
11	=ACCRINT(A2,A3,A4,A5,A6,A7,A8)	6.45833
12	=ACCRINT(DATE(2013,1,15),A3,A4,A5,A6,A7,A8)	3.54167
13		
14		
15		
16		
17		

Using the DATE function instead of referencing cell B1.
