

Create your Custom filter

With custom filters, you can keep a pre-defined filter effect and use it accordingly. You can assign brightness value for each pixel using mathematical operations. These values are assigned based on the surrounding pixels. Then you can save them as custom filters and apply these functions on any Photoshop images.

Optimised Properties Panel

Properties panel used to be the first place to get complete information about the current layer. Several quick actions have released in the latest version such as remove background that uses the Adobe AI Sensei technology to isolate the objects and amplify them to create optimised images. You can find all the typographic tools for character & paragraph-level and several quick action buttons for converting into frame and Shape object.

New Preset Panels

With new panels added for Shapes, Patterns, and Gradients, you can easily add graphical presentations of default items such as leaf trees, wild animals, boats, and flowers. And when you select any specific shape or pattern for using then it creates a new vector layer with that shape or pattern highlighting the form.
