

4. Download manager:

The download manager is one of the most frequently used options on the web browser. This is due to two main reasons.

- A. There are a lot of things that the web browser is prone to downloading by default. Not all of those are required and sometimes, might even clutter the memory. To control that, the download manager is extensively used.
- B. Another thing that download manager is used for is quite obvious: quite simply, it is used to download things from the internet to your device. Hence, the Download Manager is of good use for all users across the world. Firefox, like most other browsers, provide this option to their customers.

5. Incremental find:

This feature is often a saviour and we are all well acquainted with it. When you use Google to search for some information, you will find predictions showing based on the related things that you may be looking for. You get suggestions and often, when you do not really know what you are exactly looking for, this feature comes in handy.

Unique features

With all the information about the common features of Firefox, out of the way, it is time to take a look at some of the unique ones that make Firefox so popular.

1. Easy to customise:

Firefox supports a large number of plugins and extensions. In fact, they support the maximum number of extensions of all the web browsers present in the market. This makes them largely customisable given all the things that a user can do to make the browser work just according to their needs.

2. Tab management efficiency:

Tabs are present for simultaneous use of the internet for more than one purpose. However, Firefox takes it a notch higher by making this all the more efficient. They can save the most frequently opened pages and present them as icons to the user. This helps the user go back to their website of choice without having to look it up every time they want to access the same.
