

Notepad++

The first choice for most when it comes to source code editing

Notepad++ is one of the most popular source code editor software available currently for programmers. It is governed by the GPL license and runs in the Windows environment. It is open-source and completely free to use. The editor component used by Notepad++ is from Scintilla. The latest version of Notepad++ supports nearly 79 programming languages.

Notepad++ is ideal for both casual users and professional programmers. If you are comfortable using the Windows Notepad or WordPad, then using Notepad++ is a piece of cake.

One of the unique aspects of Notepad++ is the software's attempt to reduce the world's carbon dioxide emissions by optimizing the number of routines it runs, which in turn uses less CPU power. This reduces power consumption, apparently leading to a cleaner environment.
