

Notepad++ is preferred by many developers owing to its user-friendliness, coupled with many other features that have become part and parcel of many developers coding life. For example, one of the features is the ability to save all files in one go. Though this looks quite basic, it is one of the most important functionalities of Notepad++. Imagine you are working on twenty different codes and you want to save the files before your wrap up. Don't you think it is better to have a button to save all the files in one go instead of doing it one by one?

Along with this, there are multitudes of other features of Notepad++ which are quite famous amidst developers.

What are the popular Features of Notepad++?

Notepad++ is preferred by thousands of coders across the world owing to the following features.

1) Internationalization

It is one of the few source code editors that support internationalization with the help of XML files. These files are in an application-specific format encompassing all the internationalized strings in a particular language and then the file can be reloaded from application settings. In order to translate to a new language, all you have to do is to edit an existing file.

2) Plugins support

Being open-source software, Notepad++ lets you have plugins for each and every requirement of yours. The only catch being the installation has to happen through the built-in plugin manager.

At the time of starting the application, the plug-in manager automatically downloads the entire list of plugins. However, it shows only the list of stable plugins by default. If needed, this can be modified.

You can also pull some community developed plugins from GitHub into Notepad++.

A few popular plugins are Compare, Combine, FTP, Plugin Manager, etc.

3) Fully customizable UI

Notepad++ is one of the most user-friendly software owing to the possibility of completely customizing its UI. One of the effortless but useful adjustments in Notepad++ is control of whether the tabs align vertically or horizontally or one behind another. Each tab can be made to run separately
