

with their individual close button to close it at any point in time without impacting others.

You can even work with the help of split screens using more than one file. You are also allowed to open multiple files that have different language settings and still ensure that things work the way they are expected to. One of the most significant advantages of a tabbed interface is that you can avoid a cluttered taskbar especially when you have to deal with a lot of open files at once.

Notepad++ also comes with multiple themes to choose from. You can select them from Settings > Style Configurator. You can customize it even further by choosing the background and foreground colour and fonts to create your own theme.

The customization also extends to the keyboard shortcuts as it can be completely configured to suit your needs.

4) Macros

Macros have become an integral part of many software including Notepad++. It is quite a useful feature to have since it can record complex operations and automatically repeat thereby preventing you from doing it manually again. The value of macros is felt even more when you have a large data set. The recorder for the macros is very handy and placed perfectly in the user interface of the software.

For example, you have a huge data set with multiple entries and you wanted to replace the line breaks with commas. You could simply do it for the first item and then run a macro to make Notepad++ do this task automatically for the rest of the list.

5) Syntax Highlighting and Syntax Folding

This is another interesting feature present in Notepad++ where you can highlight reserved words and comments in different colours to differentiate between them easily. C, C++, SQL, Perl, Shell are some of the languages that support this feature. You can also define your own syntax highlighting.

6) Auto-completion

Notepad++ is capable of 2 types of auto-completion viz. Auto-completion of words and auto-completion of functions. Both these functions are quite handy when you are typing fast and would like the software to take some load from you while coding.
