

minimum Internet bandwidth, thereby, speeding up the overall process of the download.

uTorrent has established itself as one of the leading torrent clients for downloading, uploading and distributing torrents.

By keeping itself ahead of other BitTorrent competitors, it has been able to operate free of cost with the help of advertisement. The platform is also close-source, therefore, making it heavily guarded.

The uTorrent client comes with a variety of features which makes the experience of sharing and downloading content easy and seamless. Let's look at a few of them:

- There are many BitTorrent clients on the internet, but unlike them, uTorrent allows you to pause any of your given downloads at any point of time. You can easily resume your downloading content at any time as per your wish. This gives you the flexibility to use it as per your convenience.
- Talking of flexibility of use, one of the unique features of any torrent client or perhaps a content retriever is that it allows you to download the part of a content on one computer and allows you to transfer the incomplete content-file on to a different computer.
- One such feature of uTorrent that acts as a direct beneficiary for saving time while downloading the files is Magnet Link. As the name suggests, this feature creates a torrent magnet link which makes downloading of the file deemed unnecessary. This link generates the metadata which makes it easy for you as you don't have to download the main torrent file. After the metadata has been directed, you can simply click on the link which will direct you to the torrent app and you can start your download.
- When you are downloading multiple torrent files on your system, there can be a problem of congestion of network which might harm the internet bandwidth which your system is using for other apps. uTorrent uses Micro Transport Protocol (MTP) which frees up congestion of the internet bandwidth for other apps that use the internet on your system. It pacifies the ISP and executes a balancing act for all the entities that are using the internet on that particular system.
- Peer exchange is a communications protocol which allows a group of peers to share files efficiently. This protocol also allows you to share files with other BitTorrent clients.
- uTorrent enhances protocol encryption which enhances privacy
