

Browser Plugins:

Most operating systems such as Windows, macOS, Linux, and Unix-based can use VLC browser plugins. This NPAPI plugin allows the users to view MP3, Ogg, Windows Media, and QuickTime from websites without adding any other software. This plugin works seamlessly with Mozilla, Firefox, Chrome, Safari, and other Netscape or WebKit based browsers. For Internet Explorer, VLC offers an ActiveX plugin allowing MP3, Ogg, Windows Media, and QuickTime(MOV) formats to play directly from websites.

The software can also play incomplete, unfinished, damaged files or in some cases even download in progress videos via peer-to-peer networks.

Fast Hardware Decoding

VLC software is equipped with hardware decoding on major platforms. VLC also completely supports O-copy on the GPU, and can fallback when required on the software too. When high-resolution videos are coming with choppy display then VLC can use GPU accelerated decoding to ease things out. So the software uses the system's graphic chip to accelerate the decoding of a video stream. Windows Operating system has support for MPEG-1, MPEG-2, MPEG-4 Visual, VC-1, WMV3, and H.264 (MPEG-4 AVC); MacOS supports H.264 (MPEG-4 AVC); while for Linux the process entirely depends on the graphic card used.

Advance Control

VLC Software also has comprehensive controls for video and audio to customise as per your preference. You can open any file from a local directory, network, Disc, capture screenshot from videos and audios as well.

Subtitle tracks can be added with more control on text size,
