

both server and client for streaming and receiving network streams. You can start by going to the File>Convert/Stream option and a window will appear like this.

Choose the stream option and move forward. You need to fill in the detail based on the input type such as [HTTP](#), MMSH, RTP, UDP with corresponding configurations to start streaming media from your PC. Now go to CMD and open the console. Type in IPconfig to know the IP address of your system.

Now go to the second PC and go to File > Open Network. Add then type <http://192.0.0.1> where you must fill the IP address of the first PC to get output on the current VLC screen.

Stream and Download Youtube Videos

VLC also makes it easy to stream and download videos from any platform. Just go to the File from the top menu and then click on Open Network and then a window will appear. Here you can submit the file name and VLC will start streaming from the URL.

Then from Codec or Windows > Media information, you can find the link and open that link in your web browser. The video will start run-
