

The bare essentials

We've all been using our computers for decades now. And over these years, we've grown acclimatised to certain ways of doing things, be it something as simple as editing a text file or a relatively complex task of doing one's taxes. These "things" or processes often involve the use of multiple software and given that we're all creatures of habit, we've developed a need to use a couple of software to go about our daily businesses. Obviously, we tend to evolve over time and so do the software.

Over time as developers add more features, we users can do away with one or two software and drill it right down to the essentials. For example, the built-in anti-malware solution in Windows is very good and has negated the need to have a separate antivirus solution. That's what we're focusing on here. The bare essential software that people need.

Think of this FastTrack as the first of many to come. In this one, we're looking at some of the software that most of you would want on your machines. Everything from text editing tools, to browsers, to organisational tools have been covered. Some of these are paid and do have free alternatives online.

Excel, for example, can be easily substituted by Google Spreadsheets but for those who are used to the formula and syntax of Excel, switching to Spreadsheets can take some getting used to. The chapters in this FastTrack focus on the mundane tasks that you are most likely to use them
