

of Avidemux. Before starting with Avidemux, or any video editing software for that matter, it is a good idea to keep your system up to date with the latest codecs. You can download the K-Lite Codec Pack Mega, which has a bunch of extra codecs used by video encoding and editing software, and which are not necessary for just video playback. The codec pack is also available in the Digit DVD. It is also a good idea to install and update Java.

Add filters to a video

Filters are an umbrella term for all kinds of post processing options that Avidemux provides. Filters can be used to add borders, a watermark or a logo, crop a video, apply colour correction, increase the sharpness, change the fps of the video, change the size of the frame, burn in the subtitles from a video and even add basic transitions if you know exactly what you are doing. The best thing is that you can layer on multiple filters on the same video. Go to Video > Filters, then add the filters that you want. If you choose a logo, then you can change the position and transparency, if you are using it as a watermark (by tweaking the alpha value). Note that by default the logo is planted on the top right corner. You can adjust these values. Also, it is not possible to change the size of the logo through Avidemux, you will have to do that through an image editing software. Each time a filter is slapped on, there are options pertinent to that particular filter available. Even after all the filters are added, you
