

can change the options by right clicking on the filter and choosing to edit the parameters. Finally go to Video > Play Filtered to see how the video appears with all the filters added. Then go to File > Save to export the video file with all the filters.

Transcode a video

Transcoding a video allows you to change the video format. This can be useful for saving your personal DVD collection in a more lasting format, converting handycam footage for more easy editing in other software downstream, or reducing the file sizes of gameplay footage. In video output, select a codec. We suggest going for the latest HEVC (x265) or the HEVC (x264). These codecs offer the best compression around, even with a small file size. However, do note that the video playback itself is more processor intensive. If you want to tweak more advanced options, then click on Configure. You can also add filters to the video while transcoding. Click on File > Save to transcode the video. Also, if you are using the x264 encoder, you are in good company as it is the same encoder used by both Google and Facebook.

Save only audio or video

This can be useful for saving just a sound from a video, to extract a song, or to strip a video of any audio if that is needed for some reason. Open the video then go to Audio > Save Audio to save only the song or sound of a video. To strip a video of audio is a more complicated process. Go to Audio > Select Track, and uncheck the audio track. This method can also be used to add an audio track to the video. Check another box for the audio track, and then choose another file to add as an audio track. If another video file is chosen, the audio from the video file will be added to the track. Up to four audio tracks can be added to a video in this manner. Click on File > Save to export the video.

Editing a video

Now, let us see how to edit a video, which is the most important use case for Avidemux. We will be looking at three increasingly complex tasks. The first is to open a video, and save a small clip as a separate file. The second is to open a video, cut out unnecessary bits, and save a video file. The third is to string together multiple videos, and cut out portions from all of them, and save as a file.
