

Edit a video for social media

To edit multiple clips into a single video file, you will first have to add all the videos to the timeline. Go to File > Open and select the first file. Then go to File > Append, and select another file. You can append as many files as you want, but can only do so one at a time. Once you have added all the clips that you want in the timeline, you can go about using the A and B markers to delete all the stuff that you do not need. Now, there are a number of options that you can use for the audio. The original audio of all the videos will be preserved in track one. You can add an additional background theme for the entire video by selecting an audio file, or even actually a video file by going to Audio > Select Track, checking on Track 2 and selecting the file. Now, it is also possible to add a voice over or narration, as long as you have a file saved for the same. Finally, use the filters options to add borders, a watermark or a logo. Once all of this is done, select File > Save to export your video.
