

happens. There are a ton of options that you can use depending on your use case, and that use case is very likely to be an option. The Web menu has options for Discord and Vimeo, the Devices menu has options for Android, Apple devices, Fire Stick, Roku, Chromecast and video gaming consoles. For desktop use General > Fast 1080p30, which encodes videos at 1080p and 30 FPS. This is also the default setting. The iPod 5G requires a fancy custom string added to the video file to support playback, and you can include this by checking the “iPod 5G support” box in the Format options. Under Subtitles, you can add tracks and choose to burn them into the video. It is however, preferably to simply add the subtitle files. Multiple audio tracks can be added in the Audio tab. Now, the rest of the options can be left as is. If the final output is too large, then this can be done through the RF slider.

Now, ideally this option should only be used if you want to further reduce the file size, keeping all other options the same. Dragging the RF slider to the right lowers the number, and increases the file size. Dragging the RF slider to the left lowers the quality, but counter intuitively increases the RF number. RF stands for Rate Factor, which is a way of communicating the desired compression quality to the x265 encoder used. Essentially, the higher the RF number, the more the compression. Now, Handbrake has a sense of humour, and the extreme right of the slider shows “placebo quality”. What this means is that while the file size will get ungainly, it does not translate to better quality at all, and those interested in getting the best quality should
