

a keyframe, Handbrake will automatically detect the closest keyframe before the selected frame or time, and fill in the required information to create a new keyframe when the video starts.

Batch process a video

Note that Handbrake will effectively cripple your computer during the transcoding process, and you cannot really do much other productive work while Handbrake is working. This is why it makes sense to make the computer do all the work when you are not sitting in front of it and using it. Handbrake makes this easy for you by allowing you to open an entire folder full of videos at once, instead of adding videos one by one, and then adding them to the job queue, like most other video processing software.

Note that while using this approach, if there are subfolders with videos in the selected folder, then these videos will not be added. In such cases, once you have provided the settings for all the videos opened from the folder, you can add it to the queue, opening another folder or the subfolder, and adding all the videos to that queue as well. While you can always open a folder, you cannot select it while you are within it. So, once you have selected a folder, click on "Select Folder". Handbrake will add the videos in the folder. Users also have the option of dragging and dropping a file or a folder to the software. Note that scanning and adding multiple files to the queue itself takes
