

Cloud-based services- TeamViewer is an easy to download and install software that also provides cloud-based access to users. It provides an option to the user through which they do not have to download or install .exe file. Even the latest version of the software is compact and can be easily installed across all of the platforms.

Designated access- it has a feature to share the files by dragging and dropping which makes it one of the best software to provide easy designated access to the verified users. It also enables the users to authorise the files without going through the two-factor authentication process in general.

Multiple simultaneous stations- The software also allows multi-platform access to the simultaneous session occurring at any time. TeamViewer 12 version and all of the later versions provide access to the users to perform multiple sessions under various tabs simultaneously.

Improved performance- the latest versions of the software are optimised to deliver supreme performance and quality images. It also consumes 30 percent less data along with 15x speed while transferring files as compared to the previous versions.

Interface- in remote connections, the features of the interface is highly influenced by the remote desktop. This also provides a centralised control bar through which the users can access all of the active connections that you might need while connecting the system to a remote computer. Teamviewer software informs the user who is controlling the system and if they need confirmation or not.

Android devices get unattended access- various other remote access software provides unattended access to Android devices but the support of the latest TeamViewer versions is incredible. This software enables the users to remotely access or control the Android devices from any point at any time

Overhauled toolbar- the unique features of the latest version of TeamViewer improvised the productivity by offering the latest remote control toolbar. It comprises of all the easy and fast access features which users can implement in a few clicks in order to achieve better workflow.

Security- TV for software has a complex security model where plenty of public and private keys get exchanged between the centralised servers and sessions. Along with the stable encryption model, this software also has two-factor authentication systems and trusted services for the users who want to lock down their system and make them secure. Its security is
