

of Slideshow files. Select the time delay between slideshow images and add background music, if you want to. You can even import the file names of the images as a text file and make your life a little easier. After all this is done, simply save the selected images as a self-contained .exe (executable) file or as an .scr (screensaver) file which can be installed onto any other computer.

Editing images

You can think of IrfanView as the free alternative to Adobe's Photoshop Lightroom. You can apply all sorts of colour filters, create your custom profiles which can then be easily applied en masse to a set of images, play around with colour levels and lastly, you can install a lot of the plugins which are compatible with Adobe software since 8BF files can be installed in IrfanView. Essentially, giving you the same experience as Lightroom with a slightly less snazzy-looking UI. To cut things short, IrfanView can do the following with images:

- Adjust color, brightness, contrast, saturation, gamma,
- Add text
- Add borders, frames
- Crop
- Convert to grayscale, adjust color depth, invert to negative
- Clone Stamp
- Draw lines, arrows, shapes
- Fill
- Fix Red-Eye
- Flip, rotate, mirror vertically or horizontally, straighten
- Paint – adjust brush size, color, shape, type
- Replace colors
- Resize image, canvas size
- Sample color
- Show histogram
- Sharpen

Adobe Lightroom is a lot more powerful than IrfanView but for the vast majority of users, IrfanView easily covers all the bases so there's little need to spend money on Lightroom when a free alternative is more than capable of handling most of the tasks that one might use Lightroom for.

IrfanView totally rocks for - Batch processing

When you have a lot of images that need to be repetitively edited in a certain
