

Install 8BF plugins which are designed to work with Adobe software

fashion, then IrfanView totally owns the space. With IrfanView, you can batch process tasks such as conversions, renaming, both together and apply a myriad set of actions. Let's take a look at the basic options first.

In this window, you can select all the files that need to be processed. This can be done manually or by importing a list from a text file. You can then set the output format, output folder and then set the save options based on what all modifications that particular file format allows.

For simple conversions and renaming tasks
