

For example, when you're saving files as JPEG, you can force the output file to be of a certain file size using the RIOT plugin. This is especially helpful when you're archiving a large set of images. Not everyone needs to save every 30 MB RAW image shot on their cameras. Downsampling them to 500 KB JPEGs will save a lot of space. Then there are all the advanced options for batch processing.

Using the advanced options, you can crop your images by setting the origin points and apply offsets. Resize to a certain dimension while preserving aspect ratio, change colour depth, flip, apply colour filters, change canvas size, add overlay text, watermark image, replace colours, change colour format, sharpen,

This is where the real fun begins

blur and a lot more. You can even create a template and use that across a lot of computers. In Photoshop, you can perform the same set of actions using macros and you queue a lot more actions given Photoshop's larger feature set but IrfanView has you covered for the most common ones. And as always, IrfanView is way faster than all the other software out there.

Conclusion

Some of us at Digit have been using IrfanView for close to 20 years because there really hasn't been another software with such a feature set, that's fast,
