

Create another text file called `package.json` and add the following lines to it:

```

•
• {
•   "name": "Bobby-B-DiscordBot",
•   "version": "1.0.0",
•   "description": "Bobby-B is the Fury",
•   "main": "bot.js",
•   "author": "Barbarian _ Monkey",
•   "dependencies": {}
• }

```

You can change practically all values here except for the dependencies and main value strings. We'll be installing the dependencies manually. Think of this file as a manifest for the Discord API.

Coding the bot

This is the main file which holds what your bot will do. In the `package.json` file which we previously created, we've specified the main file for our Discord bot will be the `bot.js` file. So go ahead and create the `bot.js` file and edit it with the following lines.

```

• var Discord = require('discord.io');
• var logger = require('winston');
• var auth = require('./auth.json');
• // Configure logger settings
• logger.remove(logger.transports.Console);
• logger.add(new logger.transports.Console, {
•   colorize: true
• });
• logger.level = 'debug';
• // Initialize Discord Bot
• var bot = new Discord.Client({
•   token: auth.token,
•   autorun: true
• });
• bot.on('ready', function (evt) {
•   logger.info('Connected');
•   logger.info('Logged in as: ');

```
