

be done using the includes, search or even by using RegEx. We'll leave that to you to figure out. Let's install the dependencies.

Installing dependencies

Open a command prompt and navigate to the folder where you have placed the three files associated with the bot. Let's say that's in E:/Temp/Bot

Install Winston which is a logger for your bot. We've already invoked it in the bot.js file in the second line itself. You can download and install Winston by typing:

- `npm install discord.io winston --save`

The other set of files you'll need can be obtained by using the following command:

- `npm install https://github.com/woor/discord.io/tarball/gateway_v6`

Gateway is simply a Discordapp library for node.js that allows your bot files from your local machine to talk to the discord API.

Fire up the bot

Once all the dependencies have been downloaded and installed, you can finally proceed to running your bot. You have previously added the bot to your server but it hasn't been made active. If you open up your Discord server and check the memberlist then the bot will appear offline. To fire it up, type the following in your command prompt:

- `Node bot.js`

Any and all errors that might be present in your code should pop up. If nothing does, then your code is running smoothly and you should see the following message:

- `{"message":"Connected","level":"info"}`
- `{"message":"Logged in as: \",\"level\":\"info\"}`
- `{"message":"Bobby-B-DiscordBot - (0000bunchOfNumbers0000)","level":"info"}`
