- ...
- Hello World!
- ---
- This slide will be shown two seconds after the presentation starts.
- Running a C program in Linux Terminal
- The following are the step by step procedure to run a C program in Linux terminal
- `$ sudo apt-get install build-essential`
- In the text editor, write your C program
- `#include<stdio.h>`
- `int main()`
- `{`
- `print("\nA sample C program\n\n");`
- `return 0;`
- `}`
- Save with the file extension as `.c`
- Execute the following command
- `$ gedit sampleProgram.c`
- Compile the program
- `$ gcc [programName].c -o programName`
- Run the program as
- `$ ./programName`

To Conclude

You will be able to use these core principles to grasp any orders on command lines that you get. However, if an order is not followed, you will at least know when one is stopped, and the other is started. You will be able to know more quickly which files you control or which other switches and parameters are used. **d**
