

CHAPTER #03

```
command      Remove unused packages and caches.
clean
config       Modify configuration values in .condarc. This is modeled
              after the git config command. Writes to the user .condarc
              file (/home/araaj021/.condarc) by default.
create       Create a new conda environment from a list of specified
              packages.
help         Displays a list of available conda commands and their help
              strings.
info         Display information about current conda install.
install      Installs a list of packages into a specified conda
              environment.
list         List linked packages in a conda environment.
package      Low-level conda package utility. (EXPERIMENTAL)
remove       Remove a list of packages from a specified conda environment.
uninstall    Alias for conda remove. See conda remove --help.
search       Search for packages and display associated information. The
              input is a MatchSpec, a query language for conda packages.
              See examples below.
update       Updates conda packages to the latest compatible version. This
              command accepts a list of package names and updates them to
              the latest versions that are compatible with all other
              packages in the environment. Conda attempts to install the
              newest versions of the requested packages. To accomplish
              this, it may update some packages that are already installed,
              or install additional packages. To prevent existing packages
              from updating, use the --no-update-deps option. This may
              force conda to install older versions of the requested
              packages, and it does not prevent additional dependency
```

MAN Pages

Delve into MAN pages, a form of software documentation for the Linux kernel

Introduction to Man pages

Man pages or Manual pages are like software documentation to know more about a specific command, program or function in Linux. They may include conventions, formal standards, library or system calls and abstract concepts about a program or function. They are distributed with the software package and can be accessed from the program without using the internet. Man pages follow a systematic mechanism to save files in the right place. All man pages are categorised for specific sections with a single character. The man pages are assigned numbers for each structure. Here are the most common structures:
