

- 32059

This is the size of the indicated file in bytes.

- 2007-04-03 11:05

Date and time of modification of the file.

- oo-cd-cover.odf

The file name.

Manipulation of files and directories

The following topic in the chapter will introduce you to five of the most used Linux Commands which are namely:

- cd: Copy directory and files
- mv: Move or rename the file or directory
- mkdir: Make or create directory
- rm: remove the file or directory
- ln: Create hard and symbolic links

1. mkdir

The mkdir command is used to create directories; you can create one or more than one directories at the same time.

- mkdir dir1 dir2 dir3

The above command will create directories dir1, dir2 and dir3.

2. cp

It is used to copy the content of a file or directory into another directory.

If one needs to copy the contents of dir1 to dir2, you can use:

- cp item1 item2

While if you want to copy multiple items and save them all into a single directory, you can proceed by this:

- cp item... directory

Options -> Option -> Meaning

- -a, --archive

Copy the content as well as the permissions and ownership of the original directory. Usually, the copy manifests the permissions and ownership of the user copying the content.

- -I, --interactive

Before operating, confirm from the user; if this option is not selected, the system will simply overwrite the existing content.

- -u, --update

This means when you copy some content from one place to another, only
